WORK EXPERIENCE

Head Developer, Go Automation

June 2026 – Present

- I was the lead developer building a document collection system. An AI-powered, multi-tenant document-collection system, built end-to-end (utilising Next.js, React, TypeScript, Supabase/PostgreSQL).
- I was in charge of the full stack, including the database schema, row-level-security design, backend, front end, and an AI-driven document-verification pipeline, with an adversarial code-review gate before every production release.
- I also managed two other developers: one delivering the Mortgage Bridge CRM, having built its first version myself before onboarding them, and another working alongside me on the Document Collection System.

AI Chatbot Prompt Writer, Go Automation

September 2024 – November 2024

- In this role, I created engaging prompts for AI customer-service chatbots.
- This helped to improve customer engagement and interaction for each client.
- As a result, more leads were converted per client on average.

User Interface Developer, BlueBeck Ltd

June 2023

- The CEO gave me the job of designing the user interface for an AI chatbot.
- I did this through Android Studio, utilising mainly Kotlin to develop the interface.
- After a follow-up meeting, the CEO was mightily pleased with the interface I developed.

EDUCATION

2024 – Present	MEng Computer Science at University of Birmingham	(Years 1 & 2: First)
2022 – 2024	A-levels at All Hallows Catholic College	(A*AA)
2020 – 2022	GCSEs at All Hallows Catholic College	(2 A*s, 5 As, 1 B)

PROJECTS

Go Automation Document Collection System

2026 – Present

A multi-tenant SaaS I am building single-handedly that lets firms collect, verify and reuse documents from their customers. Customers upload required documents mainly through WhatsApp, as well as email; the system determines what each case needs, checks document validity with AI, and can automatically reuse a document a customer already supplied on an earlier case instead of chasing it again. This was built with Next.js, React, TypeScript and Supabase (PostgreSQL) with strict per-firm row-level security. I'm developing it through a proprietary workflow built around Claude Code and Codex. Claude Code works with full context of the entire application and its roadmap, while every feature is rigorously tested with Codex as soon as it is built. This has boosted my productivity significantly.

Mortgage Bridge CRM

2026

A mobile-first Progressive Web App that gives mortgage brokers a fast, secure workflow over their existing CRM in GoHighLevel. I built the first version as an installable PWA with a lightweight Node backend, PostgreSQL storage, scrypt-hashed session authentication, role-based admin/broker access and web-push notifications. Now I lead its ongoing development alongside a second developer.

Lead-Integration Bridge

2026

A resilient webhook-to-CRM service that ingests leads from a third-party provider. It verifies each

signature, fetches the full record over an authenticated API and maps it into a client's CRM. Built stateless and idempotent so duplicate deliveries never happen. This was also validated against the live systems rather than the documentation, which caught several spec inaccuracies that would otherwise have shipped incorrectly.

Regulated Site Launch 2026

Took an FCA-regulated brokerage's website live and hardened it with security headers (HSTS, CSP, clickjacking and referrer policies). I also self-hosted its assets, verified the required regulatory disclosures, and performed a zero-downtime DNS cutover over the client's live email.

Legacy System Recovery 2026

Recovered design knowledge from an 18-month-old .NET application due for decommissioning with no source repository. I was able to reconstruct its logic and data model from old build artefacts and migration history, identifying which production behaviour was worth preserving. This delivered a prioritised backlog of which past decisions were worth carrying into the successor system.

Company Website & Compliance 2026

Maintained and matured Go Automation's marketing site and legal suite (Privacy Policy, DPA, Terms and a new subprocessors page) and implemented cookie-consent management across every page so marketing tags load only after opt-in, with each update verified programmatically rather than by eye.

NEA Game Project 2023–24

A 2D stealth game built solo in Godot (GDScript) for my A-level coursework, with all code, sprites and level design created from scratch.

AI Interface for Three 2023

During work experience at BlueBeck, I designed the UI for a customer-service AI chatbot for Three, styled as an SMS conversation with an added voice-input option.

Hackathon Projects 2025

Two university hackathon builds: a real-time speech and text translator (runner-up), and a nostalgia music app that plays the top song from the year a photo was taken via the Spotify API.

Portfolio Website 2025

A responsive, accessible portfolio site built from scratch with HTML, CSS and JavaScript (the home of this CV).

TECHNICAL SKILLS

Programming Languages	TypeScript, JavaScript, Python, SQL, C++, C, Java, Kotlin, GDScript, HTML/CSS
Frameworks & Tools	React, Next.js, Node.js, Tailwind CSS, Vite, Git & GitHub
Databases & Infrastructure	PostgreSQL, Supabase, Vercel, Render
Concepts & Practices	Row-Level Security, Progressive Web Apps, REST API & webhook integration, web security (CSP, security headers), authentication & session security, automated testing (Vitest), GDPR-conscious data handling
Operating Systems	macOS, Microsoft Windows
Misc.	Problem solver, team & project management, enthusiastic about gaining new skills
